dinkarahul28@gmail.com
Portfolio Medium Blog
LinkedIn Profile
Gurugram, India

SKILLS

Frontend: ReactJS, React Native, Redux, React Query, D3.js, Webpack, Vite

Languages: TypeScript, JavaScript

AI & Automation: AI coding agents, agent rules and skills, AGENTS.md, automated task-to-PR pipelines

Tools & Platforms: Git, CI/CD (GitHub Actions), testing and coverage, custom ESLint, AG Grid, shadcn/ui, JIRA, Agile/Scrum

Leadership: Technical direction, cross-team work, mentoring, developer experience

EDUCATION

IIT Roorkee, Uttarakhand 2015 - 2019
Bachelor of Technology CGPA: 6.768

Haryana Board of School Education 2015
Twelfth Percentage: 81.8%

Haryana Board of School Education 2013
Tenth GPA: 9.0

INTERNSHIPS

Software Engineer
May 2018 - July 2018
Innoplexus Consulting Services Pvt. Ltd., Pune

Lead Frontend
June 2017 - August 2017
Docconsult Services LLP, Jaipur

ACHIEVEMENTS

2nd place, Synaptic Hackathon 2023 – Led team effort on social network insights prototype.

Star Player of the Team, Jan 2025 – Recognised for technical leadership and system-level impact.

Published blog on **state management architecture** in Synaptic Engineering.

PROFILE

I like building the systems and tooling that help a team move faster, not just shipping features. Over the past couple of years most of my work has been on things that help everyone around me: getting AI tools into our everyday development, making our codebase safe for people outside core engineering to contribute to, and automating the repetitive steps between picking up a task and opening a PR. I still care a lot about performance and clean architecture, and I spend a good part of my time mentoring engineers and improving how the team works.

WORK EXPERIENCE

Senior Frontend Engineer (SDE-3)

Synaptic Inc, Gurugram

April 2021 - Present

- **Set up AI coding agents for the codebase** so the team could actually rely on them. I wrote the agent rules, a set of reusable skills, and an *AGENTS.md* that captures the product and domain context an agent needs to make sensible changes.
- **Opened up the codebase to non-engineers.** Designers, QA, and people on the associate teams can now make small tweaks themselves instead of waiting on a frontend engineer. I got there by adding tests and raising coverage, writing down the 'why' behind the tricky parts of the code, and adding custom ESLint rules that catch the usual mistakes.
- **Built an automated pipeline that takes a task from issue to PR.** It picks up the task, makes the fix, runs the tests, opens the PR, and reports the result back to wherever the task came from. It clears a lot of the routine work that used to pile up.
- **Wrote custom skills for the slow, repetitive parts of the job** (ship-pr, figma-to-code, babysit-pr) so the team spends less time on them.
- **Led a rework of our frontend CI/CD pipelines.** Run-All checks went from 39 jobs to 3 and infra time dropped from about 4h 40m to roughly 12 minutes, with deploys 30 to 40% faster overall; smart lint caching and dependency reuse did most of the work. I also helped move the app into a full-stack monorepo on Vite, which cut deploy times by about 40%.
- **Brought initial bundle load down from around 10s to 4s** with Webpack chunking, route-based code splitting, caching, and trimming libraries. Also handled the Node, AG Grid, and Vite upgrades, built a dead-code detection plugin, and improved Company Screener load times.
- **Designed a unified dataset onboarding framework** that took onboarding from about 5 days down to 3 to 4 hours. Worked with design and backend to agree on standard API contracts, and built reusable components the team kept using afterwards.
- **Built Tuxedo v2.0**, a design system that runs alongside the old library so teams could move over gradually. Scoped CSS handled the theming and isolation issues. Later prototyped a shadcn/ui-based version.
- **Built the Screener module and reworked the core analytics layer**, with backend-driven filters, configurable columns, real-time tagging, and saved, shareable views. Added a chat interface and a visual query builder so people can slice the data without writing code.
- **Run our biweekly knowledge-sharing sessions** and mentor the team on how to structure code, the tooling we use day to day, and keeping an eye on performance.

Associate Software Engineer

Innoplexus Consulting Services Pvt. Ltd., Pune

June 2019 - April 2021

- **Cleaned up our React and Redux setup** by cutting the manual boilerplate around actions, reducers, and observables, and added reusable abstractions that made the codebase easier to scale, maintain, and onboard onto.
- **Improved app performance and reliability** with smarter caching and automatic retries, which made the data-heavy workflows noticeably smoother to use.
- **Built an internal charting library** that several projects used, giving us a consistent way to render complex visualisations and cutting down on duplicated work across the frontend teams.
